

Five independent lines of evidence for a focal-adhesion / FAK dependency in CDKN2A/B-null GBM

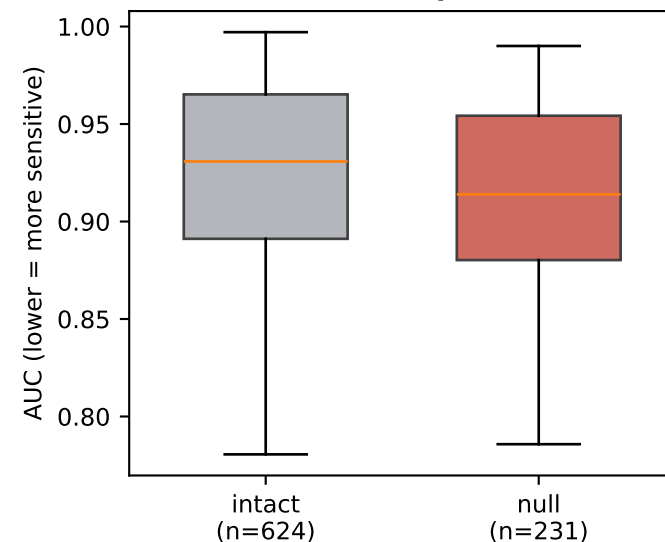

A CRISPR knockout — DepMap
(more negative = more essential in null)

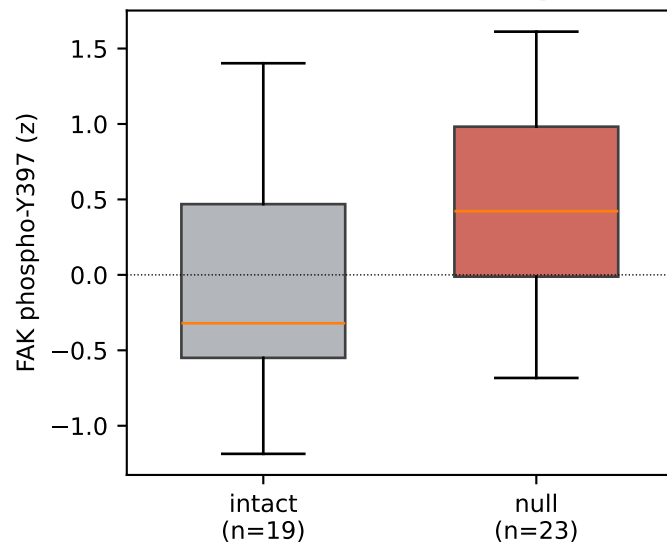

B RNAi shRNA — DEMETER2 (orthogonal) rules out CRISPR cut-artifact

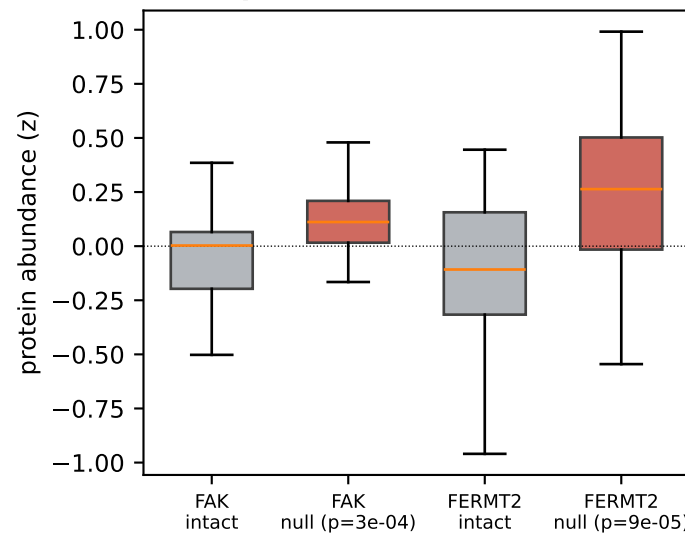

C Potent FAK-i PF-562271 — GDSC
null more sensitive, $p=9.7 \times 10^{-4}$

D Tumor phospho-FAK Y397 — CPTAC
FAK ACTIVE in null tumors, $p=1.2 \times 10^{-2}$

E Tumor protein FAK & FERMT2 — CPTAC
both up in null tumors

F Tumor RNA — TCGA-GBM
ITGAV up; null-state wiring confirmed
