

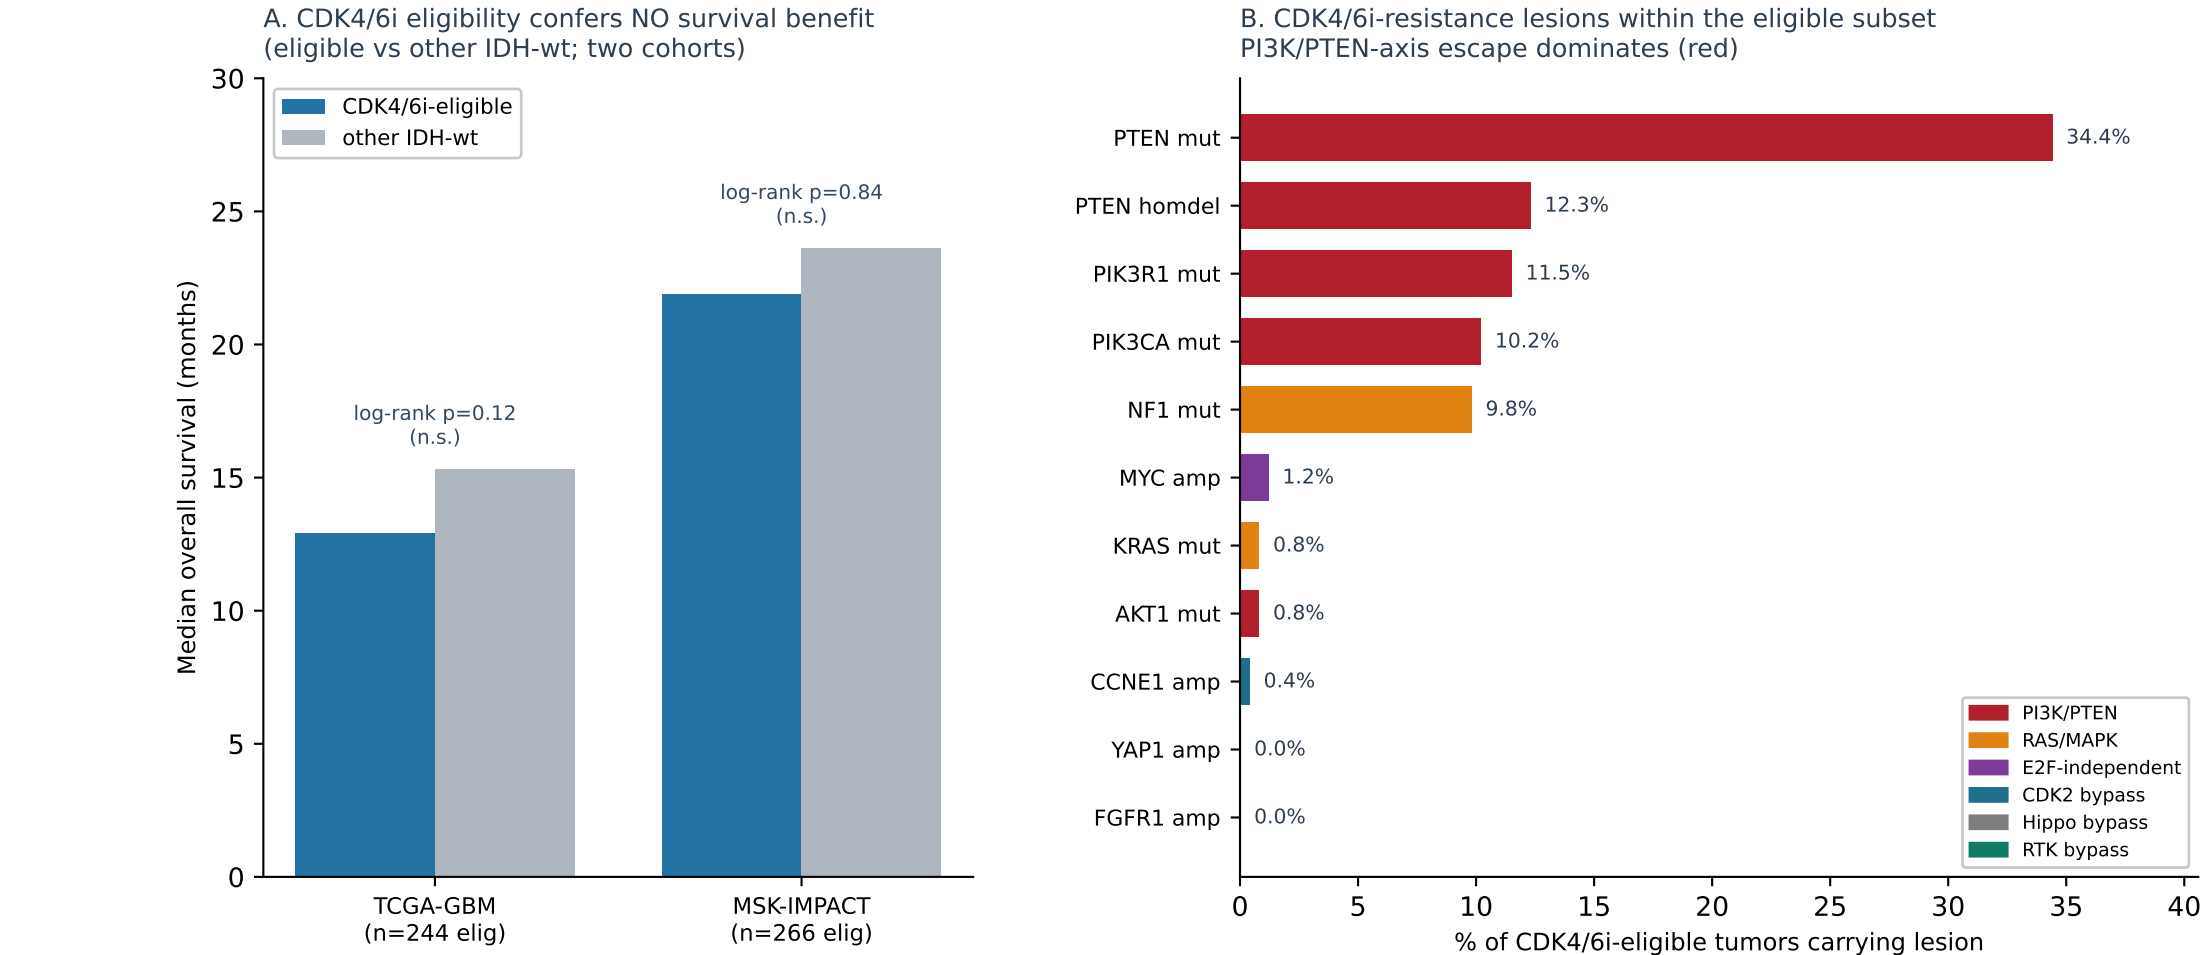

Figure 2. The CDK4/6-inhibitor-eligible IDH-wildtype GBM subset: large and definable, but no survival benefit — explained by PI3K/PTEN-axis resistance

Eligible = IDH-wt, RB1-intact, CDK4/6-axis-activated (CDKN2A/B-deleted and/or CDK4/CCND-amplified). PTEN shown as mutation (34%) and homozygous deletion (12%) separately (overlap unquantified). A CDK4/6i trial in GBM should exclude or co-target the PI3K/PTEN axis.
